

API Documentation Tools

This page describes tools for auto-generating API documentation.

Generating Python and REST API documentation is natively supported by our internal documentation tooling. Because our internal documentation tooling provides limited support for other languages, engineering teams have developed custom tools for generating other types of API documentation.

The following table lists tools for auto-generating API documentation:

Tool	Description	API Type	Native Support	Documentation
Python sub-command	Generates documentation for Python modules, classes, and functions. Use this sub-command to do the following: <ul style="list-style-type: none">Automatically update API documentation with source code changesManually generate API documentation	Python	<input checked="" type="checkbox"/>	Generate API Documentation
Sphinx Autodoc extension	Includes Python code from source code doctrings. Use this extension to generate API documentation inline with content you write.	Python	<input checked="" type="checkbox"/>	Include API Documentation Inline
Sphinx Httpdomain directive	Embeds REST API documentation inline with content you write.	REST	<input checked="" type="checkbox"/>	Document REST APIs
Bazel	Generates Scaladocs for a Scala library target. For an example of documentation that uses this tool, see the Scala API documentation .	Scala	<input type="checkbox"/>	Build Scaladocs Documentation
DocC	Creates DocC documentation from source comments. For an example of documentation that uses this tool, see the Mobile API Documentation .	Swift	<input type="checkbox"/>	Build DocC Documentation
